

021 ENG The Heavens

Isn't the nighttime sky incredible?

Just look at all of those stars.

Sometimes you can see falling stars and comets.

I like to try to identify constellations such as the Big Dipper and Orion.

When you're far away from urban lights, you can even make out the Milky Way.

With a telescope, you can see planets: Mercury, Venus, Mars, Jupiter, Saturn, Uranus, and Neptune. Pluto is no longer considered a planet.

What's that up there?

Hey, is that a UFO?

No... it was a bird!

That's all for now.

See you next time!
